21st April 2016

To whom it may concern

We at **Trimble Transport** provide a transport service to **City Air Express** near Dublin Airport. As stated in my previous testimonial, in 2013 we accepted an opportunity from Hytech Energy Europe, now known as **Eco Systems International** to carry out trials of their then new unit named the **Eco 2**. Following brief discussions, the unit was fitted to a Renault Master Van.

This particular van does a daily run to Galway and back. We are always aware of how much fuel each van uses as we monitor it very closely. To our astonishment and delight the van recorded, **c 18% savings**. We continued to monitor the van for a full month, just in case it was a once off saving. To our surprise the van repeated the same savings day after day.

We were also aware that the engine was performing much better with reduced Emissions and smoother running. The driver reported more power in the engine. However, it was pointed out to us that if that power is used, it reduces the fuel savings. As a result of the above we placed an order, and fitted out the entire fleet.

Three years later we are still very satisfied with the units. Over time we have changed out some vans, and transferred the units from the old to the new. This is a simple task and takes about 30 Minutes.

We currently run a number of long distance vehicles around Ireland, 2 of which cover approx. 750km each, 6 days a week and as you can imagine our fuel costs (and savings) are monitored closely.

I would have no hesitation in recommending the Eco family of products to any Company interested in saving money and giving something back to the **Environment in Reducing Emissions**.

Yours Sincerely

Richard Trimble
